Dear Prospective Site 300 Neighbor:

Welcome to the area. We appreciate your interest in wanting to know more about Lawrence Livermore National Laboratory (LLNL), a U.S. Department of Energy (DOE) national security facility, and Site 300. This letter is provided to help you learn more about the environmental activities at Site 300.

Lawrence Livermore National Security, LLC, (http://www.llnsllc.com) currently operates LLNL, and Site 300, for the DOE’s National Nuclear Security Administration. Site 300 is situated on 7,000 acres in rural foothills approximately six miles southwest of downtown Tracy and 15 miles southeast of Livermore. It was established in 1955 as a non-nuclear explosives experimental test facility to support the Laboratory’s national security mission.

Environmental activities at Site 300 involve the careful restoration of portions of the site contaminated by past releases of contaminants from various early program activities. DOE began investigation and characterization of Site 300 contamination in 1981, following detection of contaminants in shallow aquifers on the site.

In 1990, the U.S. Environmental Protection Agency (EPA) placed Site 300 on the National Priorities List for “Superfund” cleanup. Site cleanup is conducted under the oversight of the EPA, the California Department of Toxic Substances Control and the Central Valley Regional Water Quality Control Board. DOE and LLNL have made considerable progress in cleaning up contaminated soil and ground water and preventing further releases through active remediation measures. These measures include ground water and soil vapor treatment, soil excavation, and landfill capping.

There are no off-site exposures as determined by the federal Agency for Toxic Substances and Disease Registry (ATSDR). The ATSDR Public Health Assessment report (2005) states, “The Agency for Toxic Substances and Disease Registry has concluded that there are no past or current exposures to contaminants associated with LLNL – Site 300, and the potential for future exposure is unlikely. Therefore, there is No Public Health Hazard to residents near the site.”

If you would like to know more about these environmental remediation activities or any other aspect of the Laboratory’s environmental protection program, the best source for information is the website: https://enviroinfo.llnl.gov. It includes a link to the Site Annual Environmental Report, environmental compliance documents, and various other environment-related subjects. The Site Wide Environmental Impact Statement is also available on the website and provides a detailed look ahead at potential environmental impacts from LLNL operations. Additionally, hard copies of current Site 300 environmental documents also are placed in document repositories at the Tracy Public Library and the LLNL Discovery Center off Greenville Road at the Laboratory’s Eastgate Drive entrance.

I hope this information is helpful to you. Please contact me at (925) 423-3125 or via e-mail at wilson101@llnl.gov with any further questions.

Sincerely,

Scott Wilson
